

C# Structures

C# Structures

- **A struct is a user-defined value type.**
- **Structure is declared in a very similar way to a class, except that it can't inherit from any class, nor can any class inherit from it.**
- **Structures can take constructors (provided they have arguments), can implement interfaces and can contain numerous members.**

C# Structures

```
struct EMPLOYEE
```

```
{
```

```
    public string name;
```

```
    public short deptID;
```

```
    public EMPLOYEE(string s, short id)
```

```
    {
```

```
        name = s;
```

```
        deptID = id
```

```
    }
```

```
}
```

```
Class StructTester
```

```
{
```

```
    EMPLOYEE e = new EMPLOYEE("ACS", 2);
```

C# Structures

```
struct Coordinate
{
    public int x;
    public int y;

    public Coordinate(int x, int y)
    {
        this.x = x;
        this.y = y;
    }
}
```

Coordinate c = new Coordinate(10, 2);
